Medical Decision Making

Patient is an 86-year-old female with a past medical history listed below who presents with a 1 day history of shortness of breath. VS wnl. Considered ACS, aortic dissection, peri/myocarditis, pericardial effusion/tamponade, PTX, PNA, pleural effusion, PE, esophageal rupture, COPD vs CHF exac, covid.

External notes from prior records were reviewed.

See ED orders for each lab and/or imaging test ordered. I independently interpreted all labs and/or imaging tests ordered as documented below in the labs and imaging sections. Labs are largely unremarkable for significant acute abnormalities except WBC 23, Hgb 11.3. Imaging was interpreted by me and CXR shows RLL PNA. I also independently interpreted the EKG as documented below.

See MAR for meds given in ED. See above ED course of action regarding pt plan of care. On re-eval, discussed findings w/ pt and/or family. Overall clinical presentation more suspicious for CAP. Do not suspect severe sepsis or septic shock at this time. Escalation of care including obs/admission was considered. Management and/or test interpretations of the pt were discussed with Pulm Dr. Nair who agreed to consult on the pt as well as Dr. Joglekar/HMSL Hospitalist Team who agreed to obs/admit the pt.

Problems Addressed:

Anxiety: acute illness or injury
Community acquired pneumonia of right lower lobe of lung: acute illness or injury

Comment:

In patients suspected of having a myocardial infarction, along with all other appropriate clinical measures and actions including ECG and other diagnostics as appropriate, measure Troponin T at 0 hours and at 3 hours.

Myocardial infarction VERY LIKELY
The 0 hour Troponin T is >52 ng/L

Myocardial infarction is LIKELY

The 0 hour Troponin T is >19 ng/L and the 3 hour level is increased or decreased by at least 5 ng/L

Myocardial infarction is VERY UNLIKELY

Both the 0 hour and 3 hour Troponin T levels are <=19 ng/L, OR 0 hour Troponin T is >19 ng/L but the 3 hour Troponin T is increased or decreased by less than 5 ng/L.
